[Highly differentiated signet-ring cell carcinoma of the stomach with multiple liver metastases--report of a case]. A 64-year-old man was admitted to our hospital with complaints of general fatigue and abdominal distension. Abdominal ultrasonography revealed multiple liver tumors, and tumor markers were elevated. Endoscopic examination revealed a type 3 tumor in the antrum. Biopsy specimens revealed moderately-differentiated adenocarcinoma, and we diagnosed the tumor as a type 3 gastric cancer (Hirai). The tumor consisted of signet-ring cells with mucin pools. No lymph node metastases were found. We also examined the other body organs, but detected no other metastases. Total gastrectomy with D2 lymph node dissection was performed. The tumor was 25 x 19 x 13 mm in diameter, and contained multivacuolated large cells. The tumor was positive for p53, and negative for c-kit and CD68. The mucin pools of the cells were Alcian blue positive. It was diagnosed as a signet-ring cell carcinoma (SRC). The patient was alive without recurrence after 5 years. Anjali Rai Anjali Rai (born 13 April 1983 in Triv 82157476af
